

C#

7. ASP.NET MVC AND ASP.NET INFRASTRUCTURE

Output Caching

- [OutputCache] action filter
- Can also use on child actions

6 references

```
public class HomeController : Controller
{
    [OutputCache(Duration=60, VaryByParam="none")]
    public ActionResult Index()
    {
        ViewBag.SmtpServer = ConfigurationManager.AppSettings["SmtpServer"];

        return View();
    }
}
```

Output Cache Settings

- VaryByParam
 - Vary by “none” to always cache the same content
 - Vary by “name” to cache for every value of name parameter
 - Vary by “*” to cache for every permutation of all parameters
- Location
 - Cache on server, client, client and server
- VaryByHeader
 - Vary on an HTTP header, like Accept-Language
- SqlDependency
 - Cache until data in a SQL Server table changes

Cache Profiles

- Avoids repetition in cache attributes
- Easy to change during performance profiling

Web.config

```
<system.web>

  <outputCache>
    <outputCacheSettings>
      <outputCacheProfiles>
        <add name="short" duration="10"/>
        <add name="long" duration="60"/>
      </outputCacheProfiles>
    </outputCacheSettings>
  </outputCache>

  <customErrors mode="RemoteOnly" />
</system.web>
```

6 references

```
public class HomeController : Controller
{
```

```
    [OutputCache(CacheProfile="long")]
```

1 reference | 0/1 passing

```
    public ActionResult Index()
```

```
{
```

```
    ViewBag.SmtpServer = ConfigurationManager.AppSettings["SmtpServer"];
```

```
    return View();
```

```
}
```

Data Caching

- ASP.NET Cache API
 - Can access via `HttpRuntime.Cache`
 - Absolute and Sliding expirations
 - Cache dependencies on file system and SQL server data

Localization and Culture

- Thread.CurrentCulture property impacts formatting
 - Example:
DateTime.Now.ToString()
- Thread.CurrentUICulture impacts resource loading
- ASP.NET can set cultures according to HTTP headers
 - Accept-language header
 - Use <globalization> section in web.config

1. web.config settings

```
<system.web>
```

```
<globalization culture="auto" uiCulture="auto"/>
```

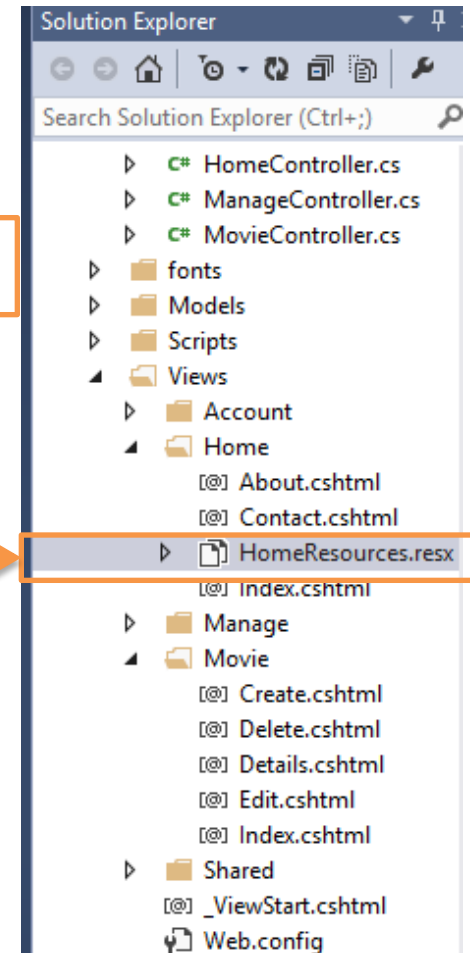

2. Display currency in view based on settings

```
@{  
    var amount = 10.0m;  
    var then = new DateTime(2002, 7, 9);  
}  
  
<div>  
    @amount.ToString("c")  
</div>  
<div>  
    @then.ToShortDateString()  
</div>
```

Resources

- a resource manager that provides convenient access to culture-specific resources at run time.
- Resx files can store localized text and binary assets
 - Strings.resx will store default resources
 - Strings.es.resx will store resource for Spanish culture
- Resource manager will load appropriate file
- Visual studio generate strongly-type class

LocalResource file
Specific to Home Controller

Resources

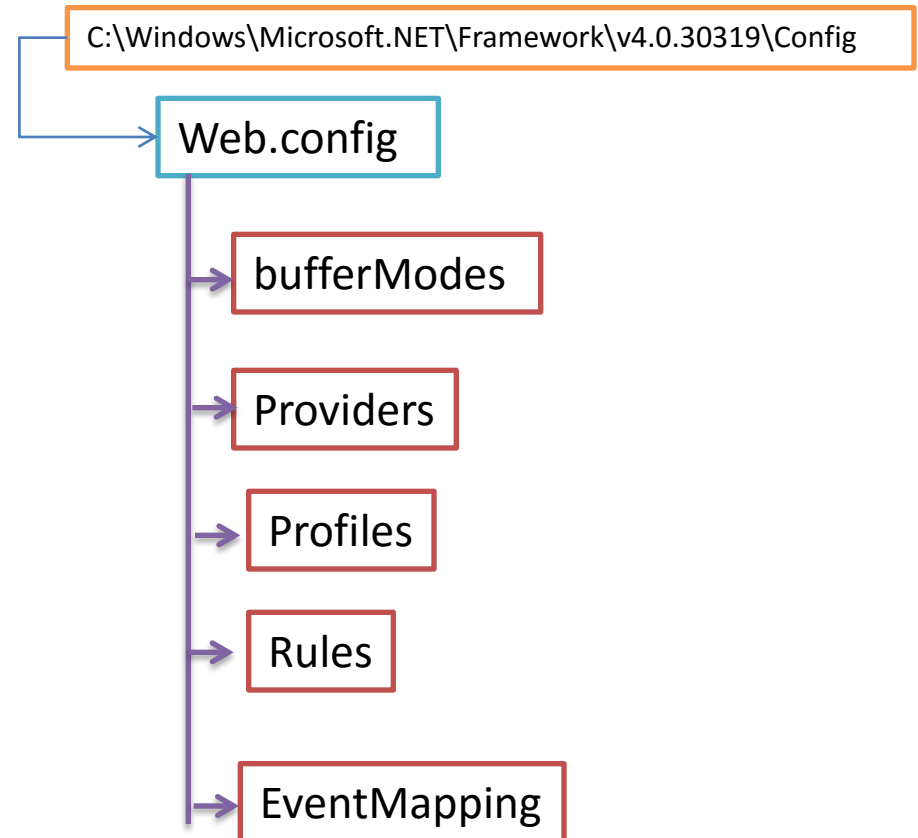

HomeResource.fr.resx HomeResources.resx Web.config Index.cshtml HomeController.cs Details.cshtml Delete.cshtml			
Strings	Add Resource	Remove Resource	Access Modifier: Public
Name	Value	Comment	
Greeting	Hello		
*			

HomeResource.fr.resx HomeResources.resx Web.config Index.cshtml HomeController.cs Details.cshtml Delete.cshtml			
Strings	Add Resource	Remove Resource	Access Modifier: No code gen
Name	Value	Comment	
Greeting	Bonjour		
*			

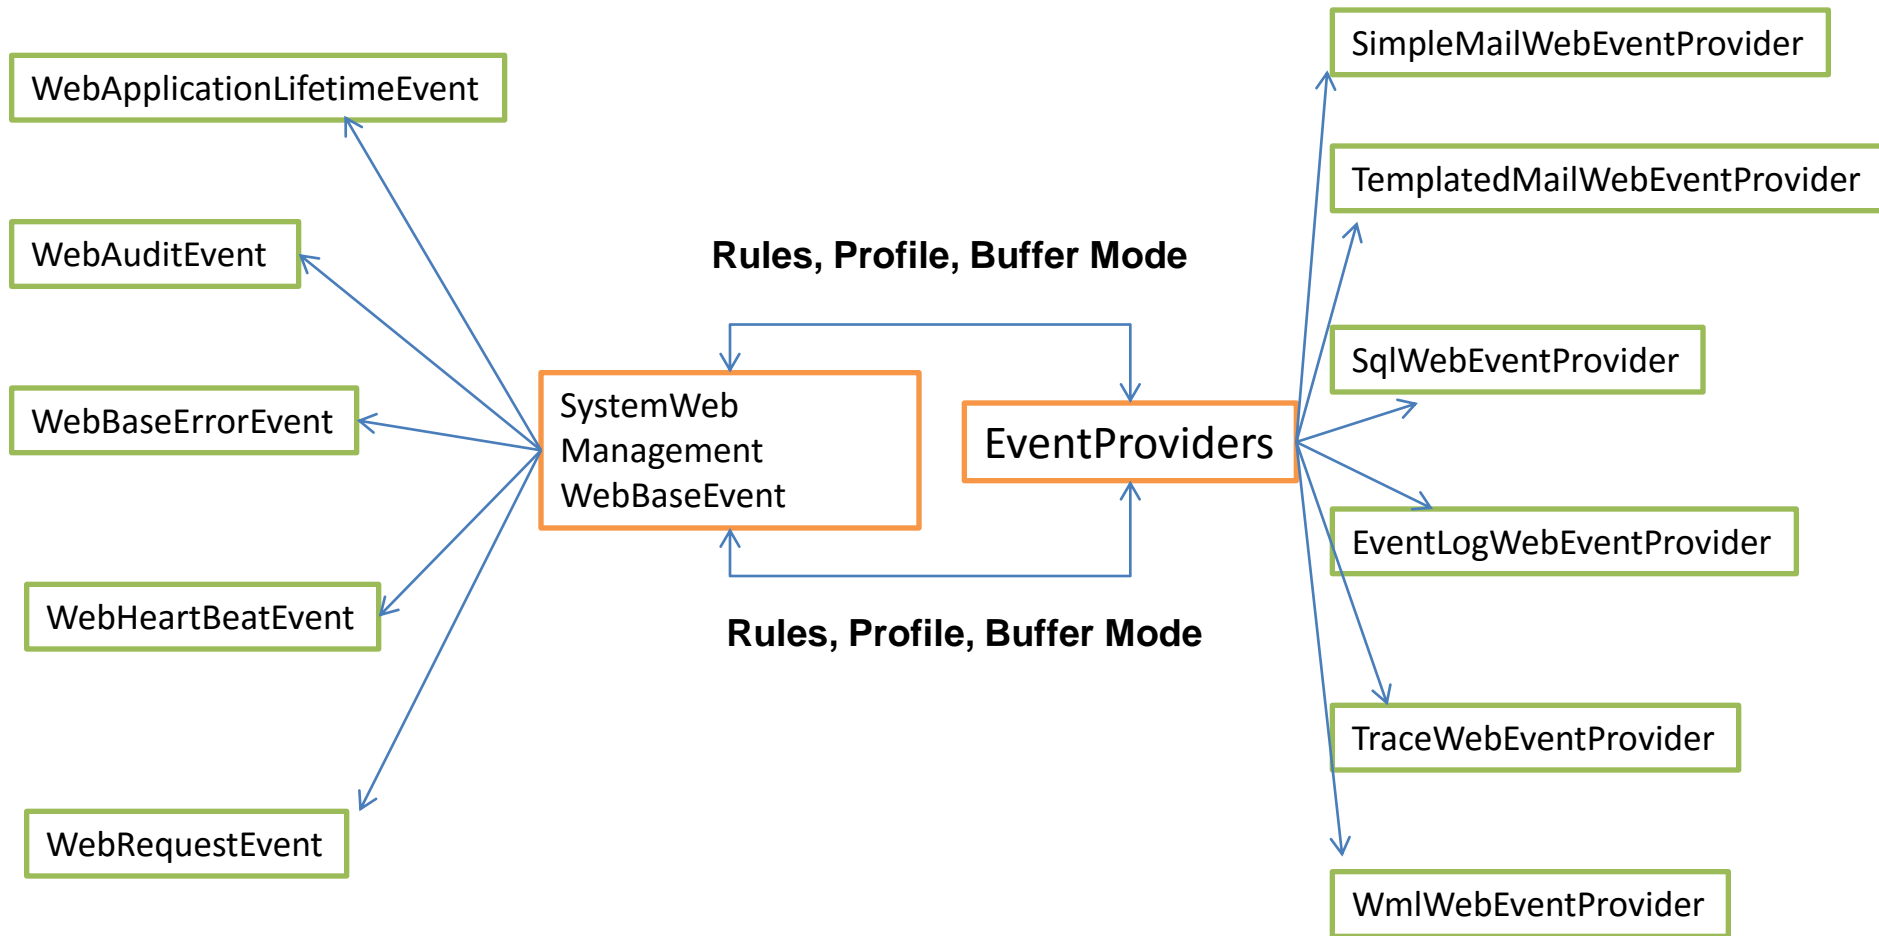

```
<div>
  <div><h3>Resource Localization demo</h3></div>
  <div>@MovieReviewApp.Views.Home.HomeResources.Greeting </div>
</div>
```

Diagnostics

- Logging Options
 - ASP.NET Health Monitoring
 - Log4net(<http://logging.apache.org/log4net/>)
 - Elmah(<http://code.google.com/p/elmah/>)
 - P&P Application Logging Block

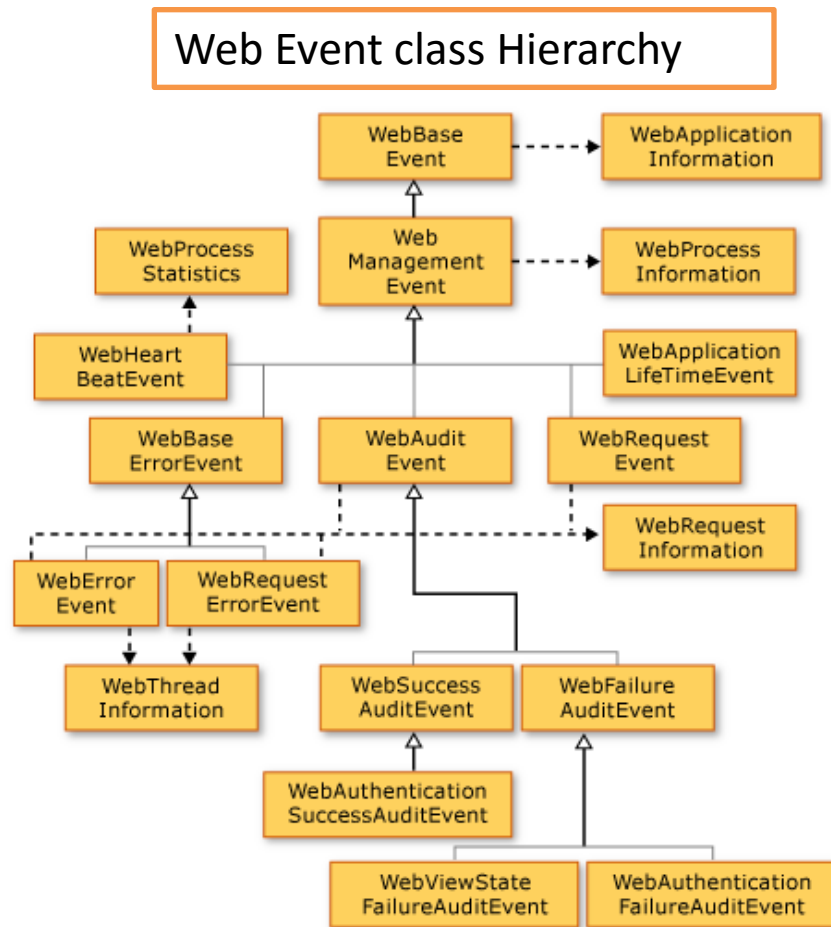

HEALTH MONITORING SYSTEM

<https://msdn.microsoft.com/en-us/library/bb398933.aspx>

ASP.NET Health Monitoring

- Monitor the performance of an application to make sure that it is healthy.
- Rapidly diagnose applications or systems that are failing.
- Appraise significant events during the life cycle of an application.
- Monitor live ASP.NET applications, individually or across a Web farm.
- Log events that do not necessarily relate to errors in an ASP.NET application.

Summary

- In this section we have covered
 - Caching
 - Performance management
 - internationalisation
